Introduction

Redd counts were used to document the spawning distribution of fall chinook salmon (*Oncorhynchus tshawytscha*) in the Snake River basin upriver of Lower Granite Dam. The first reported redd counts were from aerial searches conducted intermittently between 1959 and 1978 (Irving and Bjornn 1981, Witty 1988; Groves and Chandler 1996)(Appendix 1). In 1986, the Washington Department of Fish and Wildlife began an annual monitoring program that, in addition to the Snake River, included aerial searches of the Grande Ronde River the first year (Seidel and Bugert 1987), and the Imnaha River in subsequent years (Seidel et al. 1988; Bugert et al. 1989-1991; Mendel et al. 1992). The U. S. Fish and Wildlife Service and Idaho Power Company began contributing to this effort in 1991 by increasing the number of aerial searches conducted each year and adding underwater searches in areas of the Snake River that were too deep to be searched from the air (Connor et al. 1993; Garcia et al. 1994a, 1994b, 1996-2001; Groves 1993; Groves and Chandler 1996). The Nez Perce Tribe added aerial searches in the Clearwater River basin beginning in 1988 (Arnsberg et. al 1992) and the Salmon River beginning in 1992. Currently searches are conducted cooperatively by the Nez Perce Tribe, Idaho Power Company, and U. S. Fish and Wildlife Service.

Our objective for this report was to consolidate the findings from annual redd searches into a single document containing detailed information about the searches from the most recent spawning season, and summary information from previous years. The work conducted in 2002 was funded by the Bonneville Power Administration (Projects 1998-01-003 and 1994-03-400) and the Idaho Power Company.

Study Area

The study area included the free-flowing Snake River between Lower Granite and Hells Canyon dams and portions of the major tributaries that enter therein (Figure 1). We refer to locations using river miles (RM) and river kilometers (RK) based on navigation charts of the Snake River (USACE 1990) and U.S. Geological Survey topographical maps. Searches focused on ten river reaches: (1) the Snake River from the head of Lower Granite Reservoir (RM 147; RK 237) to Hells Canyon Dam (RM 247; RK 397), (2) the Clearwater River to the North Fork Clearwater River (RM 41; RK 66), (3) the North Fork Clearwater River to Dworshak Dam (RM 2; RK 3), (4) the Clearwater River to the South Fork and Middle Fork Clearwater river confluence (RM 74; RK 119); (5) the South Fork Clearwater River to Butcher Creek (RM 12; RK 19), (6) the Middle Fork Clearwater to the confluence of the Lochsa and Selway rivers (Clearwater RM 98; RK 158), (7) the Selway River to Meadow Creek (RM 19; RK 31), (8) the Grande Ronde River to Wildcat Creek (RM 53; RK 85), (9) the Salmon River to French Creek (RM 105; RK 169), and (10) the Imnaha River to the Cow Creek Bridge (RM 4; RK 6). The number of searches per reach varied between reaches and years. In addition, searches were conducted in other portions of the aforementioned Snake River tributaries, and in the Potlatch River, though not as routinely as in the other reaches.

Methods

Redd searches were conducted from a helicopter flown at an altitude of about 700-ft. or less. At minimum observations were made by a primary observer and the pilot, though typically at least one additional observer was present. Redd locations were determined by referencing navigation charts of the Snake River (USACE 1990), or U. S. Geological Survey topographical maps, or using a Global Positioning System (GPS) coupled with mapping software. From 1991 to 2002, searches in the Snake, Clearwater, Grande Ronde, and Imnaha rivers were scheduled to be conducted at 7-d intervals starting around mid-October and ending around mid-December. In previous years, and in the other rivers, searches were conducted less frequently. In most years some scheduled searches were canceled or shortened due to poor visibility or inclement weather. Redds observed in the Snake River that could not clearly be distinguished from the air were examined from the ground beginning in 1991. This practice

was also performed in the other rivers though less consistently. Only the number of new redds observed on each search were reported.

Redd searches in the Snake River were also conducted using underwater search methods in areas too deep to be effectively searched from the air. In 1991 and 1992, the U. S. Fish and Wildlife Service conducted underwater searches using methods developed by Swan (1989) that involved direct observation of the river bottom by scuba divers (Connor et al. 1993; Garcia et al. 1994a). From 1993-2002, the U. S. Fish and Wildlife Service and Idaho Power Company conducted underwater searches using a video system consisting of a video recorder, submersible camera (with a 110 degree lens and 65-ft camera cable), and monitor. The camera was either enclosed in an aluminum sheath mounted on a 90-lb lead weight, or attached to an aluminum frame mounted between two 30-lb lead weights, and could be adjusted 45 to 90 degrees down from horizontal (Groves and Garcia, 1998). The camera was suspended from a boat using a wire rope passed through a roller on the bow and attached to a sounding-reel/depth-indicator mounted in the boat cabin.

Searches using submersible cameras were accomplished by passing the camera over the river bottom in parallel paths spaced roughly 30 ft. apart. Camera position was determined by sight estimation, measuring cord laid along the shore, or GPS. The distance between the camera and river bottom, and the angle of the camera, was adjusted to maximize the amount of viewable area without losing the ability to observe details of the bottom substrates. If a redd was observed, the distance between passes in the search pattern was reduced, and in most cases, the entire area was searched at least two times in the course of the spawning season.

Underwater observations of redds were recorded on video tape beginning in 1993. When large groups of redds were found, coordinates were recorded using electronic surveying equipment or GPS. The numbers of redds in large groups were verified by reviewing video tape while referencing a plot of redd coordinates. In areas where redds overlapped and could not be identified individually, the perimeter of the redd group was surveyed and the overall area divided by 45.8-m² per redd based on measurements of fall chinook salmon redds in the Snake and Columbia rivers (Groves and Chandler 2001). This produced an index count of the total number of redds in the group.

Underwater searches were limited to areas greater than about 10-ft deep with a dominant bottom substrate particle size (Bovee 1982) ranging from 1- to 6-in. diameter (Raleigh et al. 1986). In 1991 and 1992, a few pilot searches were conducted at known spawning sites. From 1993 to 2002, we attempted to annually search about 90 areas that fit the substrate size and the depth criteria (based on Hells Canyon Dam discharged of about 9,000 cfs). Some of the spawning sites that were typically only searched from the air were also searched using submersible video cameras during spawning seasons when Hells Canyon Dam discharge was greater than 9,000 cfs.

Results and Discussion

Snake River

In 2002, a total of 1,113 redds were observed in the Snake River (Table 1), of which 878 were observed during seven aerial searches (Table 2) and 235 during searches of 60 deep-water sites (Tables 3 and 4). Visibility ratings were reported as either "fair" or "good" during aerial searches in 2002 (Table 5). The locations of all redds counted in the Snake River study area during aerial searches since 1986 are given in Appendix 2. The numbers of searches conducted in the Snake and other rivers are given in Table 6. The locations of all redds observed using submersible cameras are given in Table 7. The locations of all redds counted (aerial and underwater counts combined) in the Snake River study area since 1986 are given in Appendix 3. Redds counted in the Snake River amounted to 60% of all redds observed upriver of Lower Granite Dam in 2002, compared to 54% in 2001, 65% in 2000, 64% in 1999, 61% in 1998, and 31% in 1997. The percentage of redds counted using submersible cameras from 1993 to 2002 averaged 28.4%±10.4% for the Snake River, and 16.2%±6.8% for all redds counted above Lower Granite Dam. In

2002, the greatest number of new redds were observed on November 4 (Table 2 and Figure 2). On average, redd counts in the Snake River peak between November 10 and November 16 (Table 8 and Figure 3).

In this report we changed the numbers of redds counted using submersible cameras in 1995 and 1996. In earlier reports we used a conversion factor of 17 m² based on redd-size data from the Columbia River (Chapman et al. 1986) when estimating the numbers of redds contained in large patches of disturbed substrates where individual redds could not be counted. Although we began using a new conversion factor (45.8 m²) for redds reported in 2001, this is the first year the new value was applied to data collected prior to 2001.

Clearwater River basin

A total of 527 redds were observed in the Clearwater River basin in 2002, 524 in the Clearwater River (Tables 1 and 9) during nine aerial searches for fall chinook salmon redds (Table 6), and three in the Potlatch River during searches for coho salmon redds. Observation conditions varied from "poor" to "excellent" during aerial searches of the Clearwater River in 2002 (Table 10). The locations of all redds counted in the Clearwater River are given in Appendix 4. Redds counted in the Clearwater River basin amounted to 28% of all redds observed upriver of Lower Granite Dam in 2002, compared to 26% in 2001, 32% in 2000, 32% in 1999, 26% in 1998, and 38% in 1997. In 2002, the greatest numbers of new redds were observed on November 4 (Table 9 and Figure 2). On average, redd counts in the lower Clearwater River (RM 0 to RM 41) peaked between October 27 and November 4 (Table 11 and Figure 3).

Grande Ronde River

A total of 111 redds were observed during seven searches of the Grande Ronde River in 2002 (Tables 1, 6, and 12). Observation conditions were reported as "good" on all flights (Table 13). Redds counted in the Grande Ronde River amounted to 6% of all redds observed upriver of Lower Granite Dam in 2002, compared to 15% in 2001, 1% in 2000, 2% in 1999, 8% in 1998, and 29% in 1997. The locations of all redds counted in the Grande Ronde River are given in Appendix 5. In 2002, the greatest numbers of new redds were observed on October 21 (Table 12 and Figure 2). On average, redd counts in the Grande Ronde River peaked between October 20 and November 30 (Table 14 and Figure 3).

Imnaha River

A total of 72 redds were observed during seven searches of the Imnaha River in 2002 (Tables 1, 6, and 15). Observation conditions were reported as "good" on all flights (Table 16). Redds counted in the Imnaha River amounted to 4% of all redds observed upriver of Lower Granite Dam in 2002, compared to 3% in 2001, 2% in 2000, 2% in 1999, 4% in 1998, and 2% in 1997. The locations of all redds counted in the Imnaha River are given in Appendix 6. In 2002, the greatest number of new redds were observed on November 25. However, this likely does not reflect timing of construction since the November 25 search covered more river miles than the other searches. On average, redd counts in the Imnaha did not have a defined peak (Table 17 and Figure 3).

Salmon River

A total of 31 redds were observed during two searches of the Salmon River in 2002 (Tables 1, 6, and 18). Observation conditions were reported as "fair". Redds counted in the Salmon River amounted to 2% of all redds observed upriver of Lower Granite Dam in 2002, compared to 2% in 2001, 0% in 2000, 0% in 1999, 1% in 1998, and 1% in 1997. The locations of all redds counted in the Salmon River are given in Appendix 7. Not enough searches were conducted in the Salmon River to indicate a peak count (Table 6).

Summary

A total of 1,854 fall chinook salmon redds were observed upriver of Lower Granite Dam in 2002 (Figure 4). This was the largest number of redds counted since annual searches began in 1986. The increase in the number of redds counted corresponded with an increase in the number of adult fall chinook salmon counted in the Lower Granite Dam fish ladder (Table 19 and Figure 4). The number of adult fish counted passing Lower Granite Dam per redd counted upstream averaged 23.9 ± 35.4 from 1986 to 1992, 4.7 ± 0.9 from 1993 to 2002, and 5.4 in 2002 (Table 19). Most of the redds (60%) were observed in the Snake River, followed by the Clearwater River basin (28%), Grande Ronde River (6%), Imnaha River (4%), and Salmon River (2%).

^a The targeted search area was the entire reach from the head of Lower Granite Reservoir to Hells Canyon Dam.

^b The targeted search areas were discrete sites composed mainly of 1-6 in. bottom substrates in water over 10 ft. deep. The number of sites searched varied. Searchers recorded a 170 m² patch of disturbed substrates in 1995, 238 m² in 1996, 1,226 m² in 2001, and 1,282 m² in 2002 at RM 179.6 (RK 289). In this report we used a conversion factor of 45.8 m² per redd to estimate the numbers of redds within these patches. In previous reports a conversion factor of 17-m² per redd was used to estimate redds in 1995 and 1996.

^c Searches covered from the mouth to the Ahsahka boat ramp in 2002. Searches covered from the mouth to Dworshak Dam in previous years.

Table 2. New fall chinook salmon redds counted during aerial searches of the Snake River in 2002 (Data collected by Idaho Power Company and the U.S. Fish and Wildlife Service). Counts are presented by river mile (RM), river kilometer (RK), and date. An empty cell indicates no survey was conducted over the corresponding river mile, and a dash (-) indicates no redds were observed on the corresponding date.

RM	RK	New redds counted by flight date									Totals

Table 3. Record of fall chinook salmon redds counted in the Snake River using submersible cameras in 2002 (Data collected by the Idaho Power Company and U.S. Fish and Wildlife Service). Counts are presented by river mile (RM) and river kilometer (RK). At RM 179.6, 47 individual redds could be counted, plus an area of 1,282 m² of disturbed substrate equaling 28 redds using a conversion factor of 45.8 m² per redd.

RM	RK	Redds

		5	0	67	14	24	33	9	50	100	91	174	235

^a At RM 179.6, a 170 m² patch of disturbed substrates was observed in 1995, 238 m² in 1996, 1,226 m² in 2001, and 1,282 m² in 2002. The numbers of redds were estimated using 45.8 m² per redd.

^b RM 211.9 and 219 are not deep-water sites. Cameras were used in 1999 for ground truthing due to poor observation conditions.

Table 8. Numbers of redds counted during aerial searches of the Snake River, by week of the year, 1993-2002. An empty cell indicates no searches were conducted in the corresponding week and year.

Week	Calendar Days		Year

Appendix 3

Fall chinook salmon redds counted in the Snake River during aerial and underwater searches, by river mile (RM), river kilometer (RK), and year (1986-2002). A dash (-) indicates no redds were observed at the corresponding site and year.

Appendix 4

Fall chinook salmon redds counted in the Clearwater River during aerial searches, by river mile (RM), river kilometer (RK), and year (1988-2002). A dash (-) indicates no redds were observed at the corresponding site and year. The maximum upstream RM searched was 41 (North Fork Clearwater River) from 1988 to 1990, 67 (Kamiah, Idaho) in 1991, and 74 (beginning of Middle Fork Clearwater River) from 1992 to 2002. An empty cell indicates no searches were conducted in the corresponding site and year.

Appendix 5

Fall chinook salmon redds counted in the Grande Ronde River during aerial searches, by river mile (RM), river kilometer (RK), and year (1992-2002). A dash (-) indicates no redds were observed at the corresponding site and year. Redd searches were also conducted from 1986 to 1991, however, no ground locations were recorded. Redd counts totaled 0 in 1986, 7 in 1987, 1 in 1988, 0 in 1989, 1 in 1990, and 0 in 1991. The maximum upstream RM searched was 4.5 in 1986, 36 in 1987, and 45.5 from 1988 to 1991, 45.3 in 1992, 53 in 1993 and 1994, 45.3 in 1995, and 53 from 1996 to 2002.

Appendix 6

Fall chinook salmon redds counted in the Imnaha River during aerial searches, by river mile (RM), river kilometer (RK), and year (1992-2002). A dash (-) indicates no redds were observed at the corresponding site and year. An empty cell indicates no searches were conducted in the corresponding site and year. Redd searches were also conducted from 1987 to 1991, and in 1999 and 2001, however, no ground locations were recorded. Redd counts totaled 0 in 1987, one in 1988 and 1989, three in 1990, four in 1991, three in 1992, nine in 1999, and 38 in 2001. The maximum upstream RM searched was 4.1, 19, 9.8, 3.8, 3.8, 14, 35 and 35, respectively.

Appendix 7

Fall chinook salmon redds counted in the Salmon River during aerial searches, by river mile (RM), river kilometer (RK), and year (1992-2002). A dash (-) indicates no redds were observed at the corresponding site and year. The maximum upstream RM searched was 87 in 1992, 97 in 1993, 134 in 1994, 105 in 1995, 87 in 1996, 134 in 1997, 105 in 1998, 96 in 1999 and 2000, and 105 in 2001 and 2002.
